DEPTH-FIRST SEARCH – WATER JUG PROBLEM

AIM:To implement water jug problem using DFS

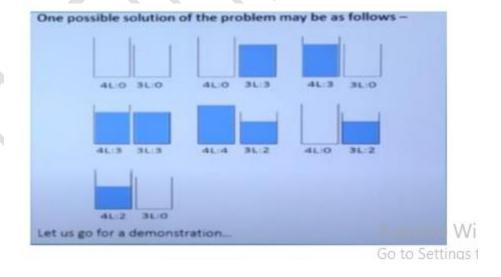

In the water jug problem in Artificial Intelligence, we are provided with two jugs: one having

the capacity to hold 3 gallons of water and the other has the capacity to hold 4 gallons of water.

There is no other measuring equipment available and the jugs also do not have any kind of marking

on them. So, the agent's task here is to fill the 4-gallon jug with 2 gallons of water by using only

these two jugs and no other material. Initially, both our jugs are empty.

CODE:

```
def fill 4 gallon(x, y, x max, y max):
   return (x max, y)
def fill 3 gallon(x, y, x max, y max):
   return (x, y max)
def empty 4 gallon(x, y, x max, y max):
   return (0, y)
def empty 3 gallon(x, y, x max, y max):
   return (x, 0)
def pour 4 to 3(x, y, x max, y max):
   transfer = min(x, y_max - y) # Max amount we can transfer from 4-
gallon to 3-gallon jug
   return (x - transfer, y + transfer)
def pour 3 to 4(x, y, x max, y max):
   transfer = min(y, x max - x) # Max amount we can transfer from 3-
gallon to 4-gallon jug
   return (x + transfer, y - transfer)
def dfs_water_jug(x_max, y_max, goal_x, visited=None, start=(0, 0)):
   if visited is None:
       visited = set() # Set to keep track of visited states
   stack = [start] # Stack to store the states for DFS traversal
   while stack:
       state = stack.pop()
       x, y = state
       if state in visited:
            continue
       visited.add(state)
       print(f"Visiting state: {state}")
        if x == goal x:
            print(f"Goal reached: {state}")
            return state
              next states = [
            fill 4 gallon(x, y, x max, y max),
```
